CC Twin Tank

CONTINUOUS SUPPLY OF SOFTENED WATER

**CC Twin Series Water
Conditioning System**

Reduce the Effects of Hard Water

The CC Twin Tank provides efficient simplicity in a twin-tank format to be used in large volume households. The twin alternating system uses already softened water down to the last drop instead of maintaining a reserve like single tank systems, which saves on water and energy and keeps hard water from ever entering your home.

System Features

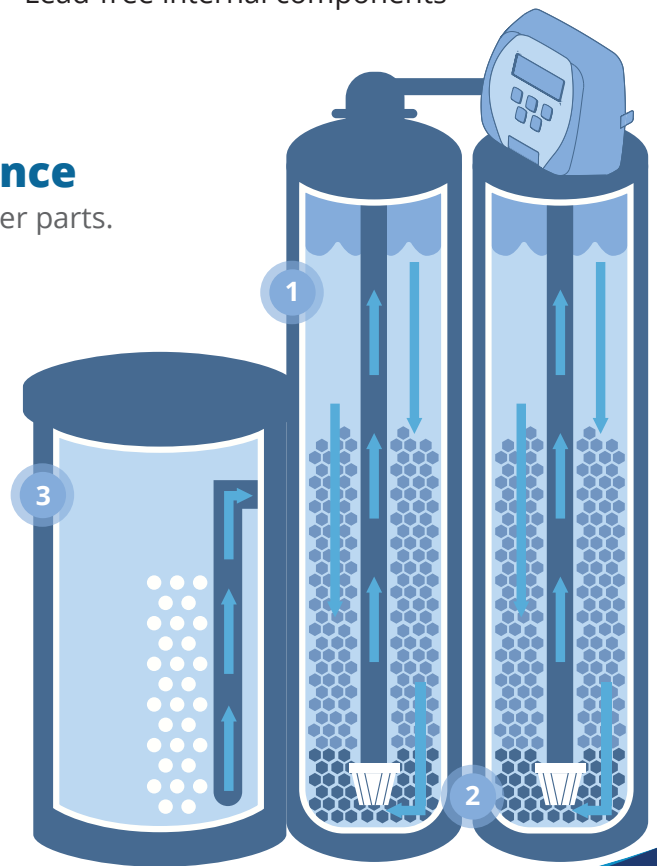

- Economy, High Efficient and Premium options available
- Corrosion-resistant control valve, body and tanks for a longer life
- Downflow and Upflow Regeneration options available
- On demand 24/7 treated water
- Full-flow bypass valve for convenience of bypassing the water softener
- Adaptive Reserve Capacity - Learns your water usage and adjusts automatically, reducing waste & improving efficiency
- Lead-free internal components

CC Twin Tank for Superior Performance

The CC Twin Tank is made with better technology and fewer parts. This means fewer problems and maintenance calls.

How the CC Twin Tank Works

- 1 As hard water moves through the tank, resin beads attract and collect hard water minerals by exchanging them with sodium.
- 2 As water passes through the resin bed it's softened and ready for use.
- 3 When the resin beads become saturated with hard water minerals, the regeneration cycle flushes them with brine solution, recharging the beads with sodium ions. Hardness minerals and excess brine are rinsed down the drain.
